When to change your filter cartridge

To ensure you have great tasting drinking water at your fingertips, you will need to change your Kinetico Model 9000 Drinking Water filter cartridge when you notice limescale returning to your kettle.* As with all of Kinetico's drinking water filters, changing the cartridge is just a quick twist off/ twist on - it's that simple!

**No Scale
No Problem**

Easy to install

The Kinetico Model 9000 Drinking Water Filter is easy to fit and comes with full instructions and everything you need to carry out the installation yourself, including the drinking water tap (you will need to drill a 15mm hole in your work surface or sink to mount the tap), hose, all push-fit connections and a saddle valve to tap into the mains water supply.

Filtered Drinking Water Straight from the Tap

Imagine being able to have a fresh glass of great tasting filtered water whenever you want, day or night. Now you can with the Kinetico Model 9000 Drinking Water Filter.

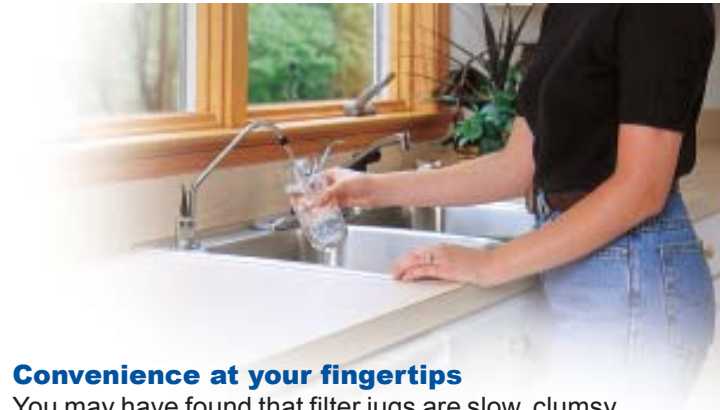

The Kinetico Difference

Mains tap water, although safe to drink does not always taste as good as it could. Chlorine, sediment and limescale (water hardness) affect the smell and taste of tap water.

Calcium and magnesium in your water supply can cause limescale build up in your kettle and leave scum floating in your tea and coffee.

Using a Kinetico Model 9000 Drinking Water Filter will significantly reduce all of these elements leaving you with refreshing, great tasting water for drinking, making ice cubes, cooking and food preparation.

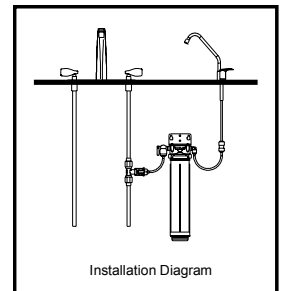

Convenience at your fingertips

You may have found that filter jugs are slow, clumsy and produce limited quantities of water, tap mounted filters are unattractive and awkward and bottled water is expensive, cumbersome and could be up to two years old.

The Kinetico Model 9000 Drinking Water Filter eliminates the problems associated with such quick fixes for a lot less than you think!

Designed to fit discreetly under your kitchen sink or counter top or any other accessible location, the Model 9000 provides the most practical alternative.

How does it work?

The Kinetico Model 9000 Drinking Water Filter uses a combination of weak acid resin and activated carbon to reduce the unwanted elements in your mains tap water.

The weak acid resin reduces the hardness ions, calcium and magnesium - the cause of lime scale, whilst the activated carbon reduces the chlorine and sediment content thus improving the taste and odour of your drinking water.
